

Cartoning Machines/Case packers ROMACO Promatic P91

Images

Product details

Category:	Cartoning Machines/Case packers
Machine:	Promatic P91
Machine code:	25-1967
Manufacturer:	ROMACO
Year of construction:	2007

Description

A feeding system (automatic or manual), located upstream of the cartoner, deposits the product on the drawer chain.

The drawer chain transports the product with an alternating movement to the area where it is inserted into the carton.

- The carton, which is picked up from the warehouse by suction cups, is then introduced into a transport system that transfers it to the next stations, keeping it square.
- At the entry station, the mechanical pusher feeds the product into the carton using a mobile channel hopper.
- The packaged carton is completed by closing the flaps as it moves towards the exit side.
- The operating logic of the P91 cartoning machines provides for the removal of the carton only when the correct product is present.

Machine type:
horizontal cartoning machine
