Product details

Category:	Laboratory Equipment
Machine:	flowstar
Machine code:	22-1236
Manufacturer:	PALL
Year of construction:	2020

Description

The test instrument is a small and lightweight portable unit.

The instrument provides the ability to perform either a forward flow test, bubble point test. Combined forward flow and bubble point test, water intrusion test or leak test. The filter can be tested in place or off-line and its performance capacity remains unaffected by the test when suitable protocols are followed.

The instrument provides direct flow measurement of the filter under test. This measurement is independent of upstream volume over a wide range. Extensive internal Self test feature and use of high precision components virtually eliminate the possibility of significant measurement errors. The instrument is connected upstream of the filter under stress. The measurements are, therefore non-invasive of the downstream side of the filter and risk of contamination is eliminated. This is particularly important in installations where the filter has been sterilized before integrity testing.
